Book

- Published December 2023
- http://udlbook.com
 - Free PDF there or buy at BU bookstore
 - Jupyter Notebooks (we'll be revising)
 - Problem Sets
- Used heavily for 1st half of the course, and a bit at the end too

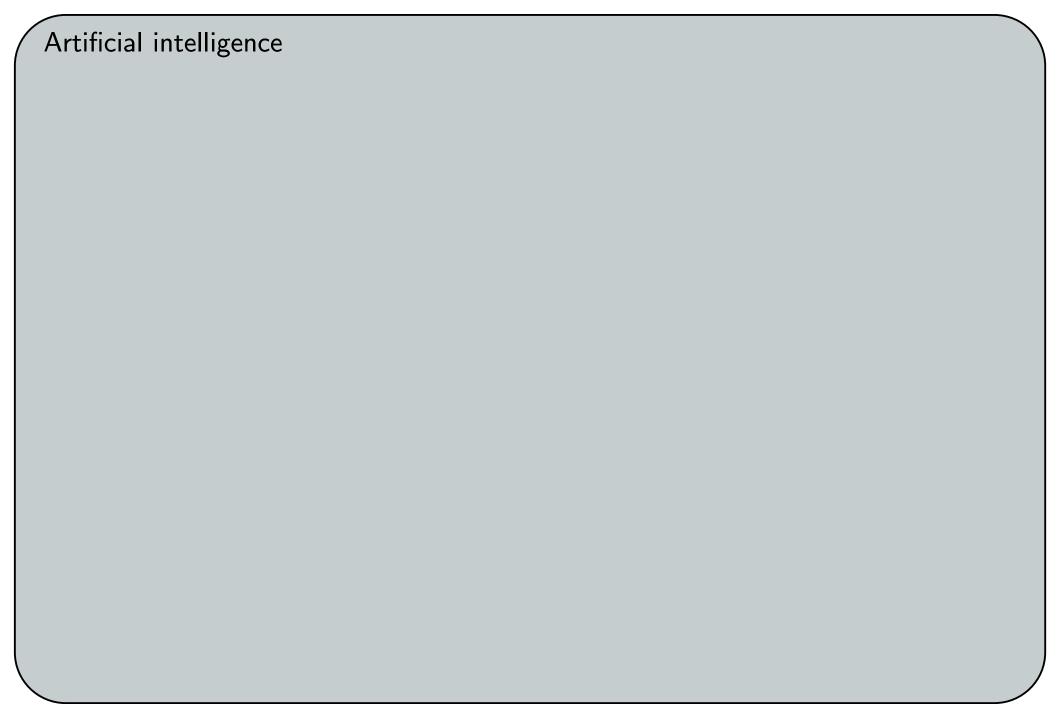

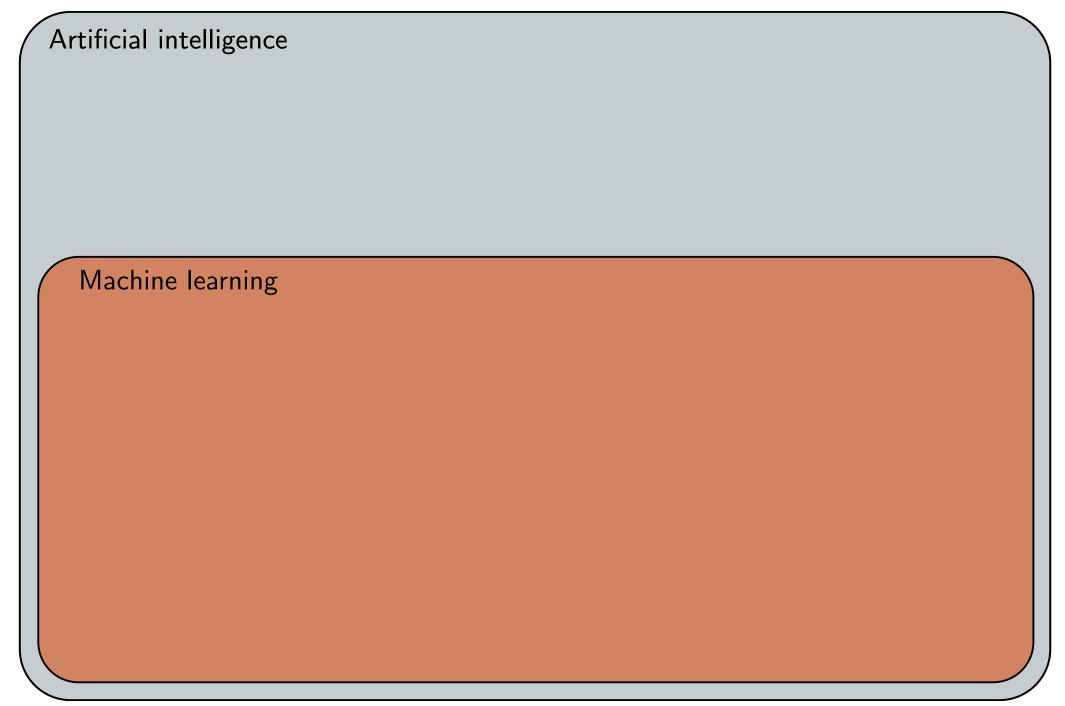

Today

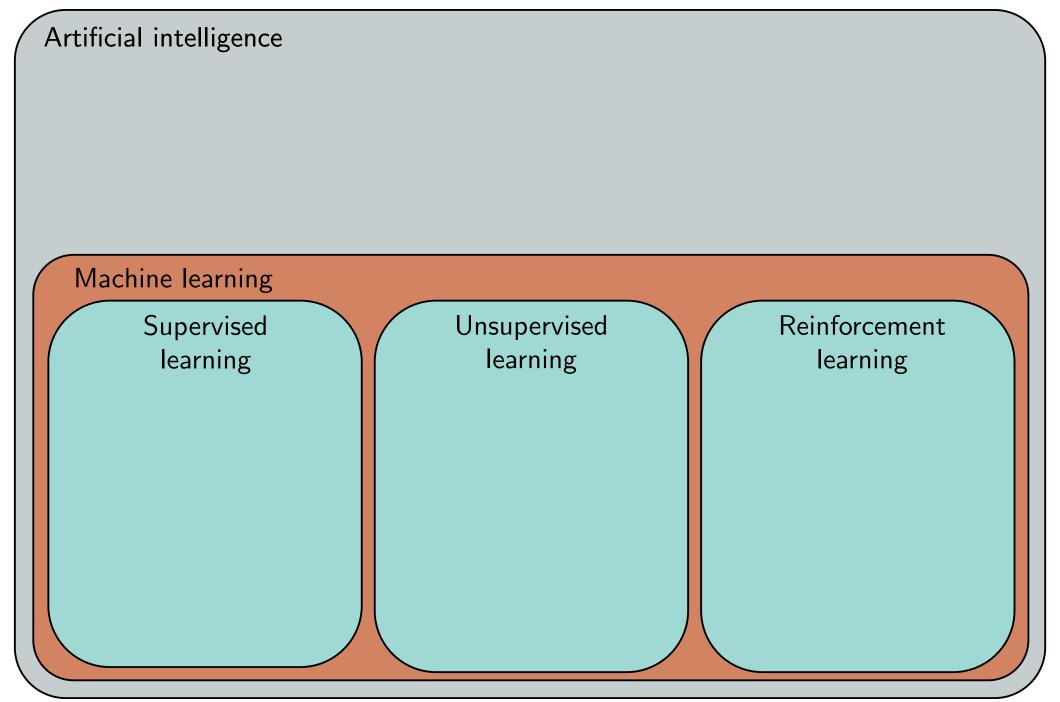

- Introduction to and Applications of Deep Learning
- History of Neural Networks
- Course Logistics

Introduction

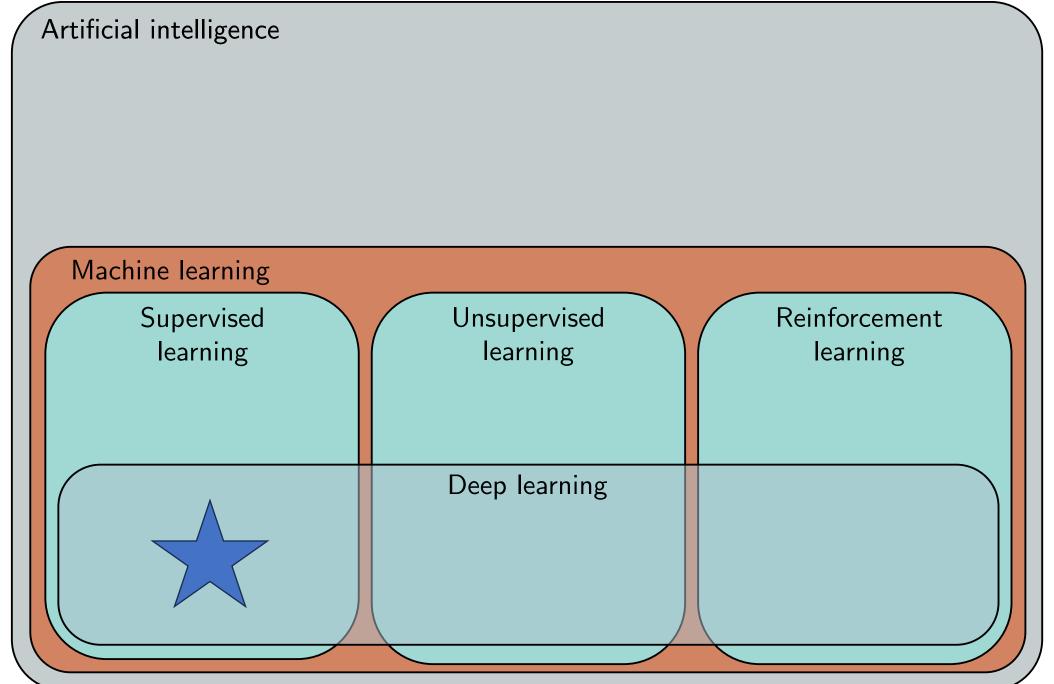

- Supervised Learning
- Unsupervised Learning
- Reinforcement Learning

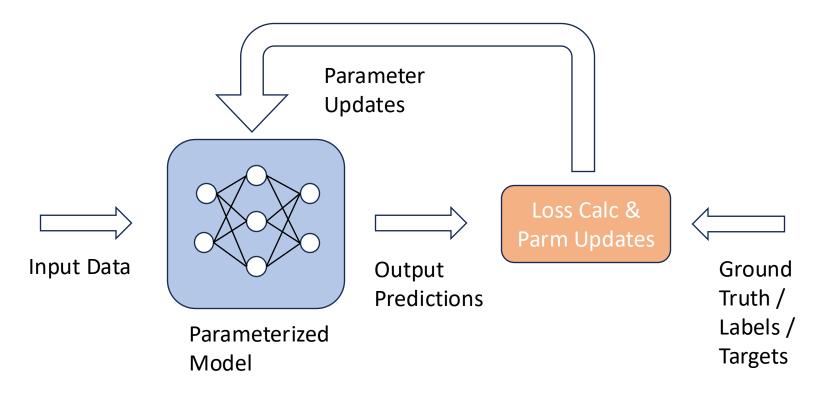

Artificial intelligence Machine learning Supervised Unsupervised Reinforcement learning learning learning Deep learning

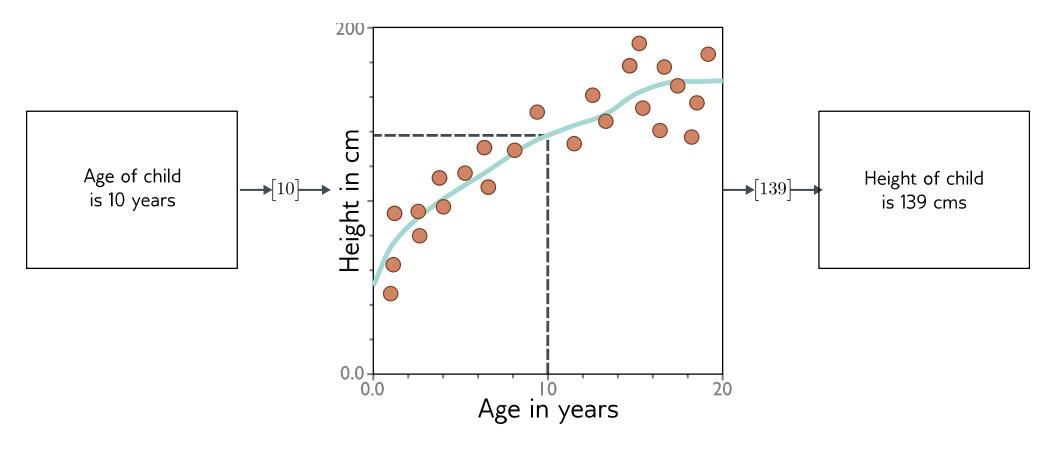

Supervised learning

- Define a mapping from input to output
- Learn this mapping from paired input/output data examples

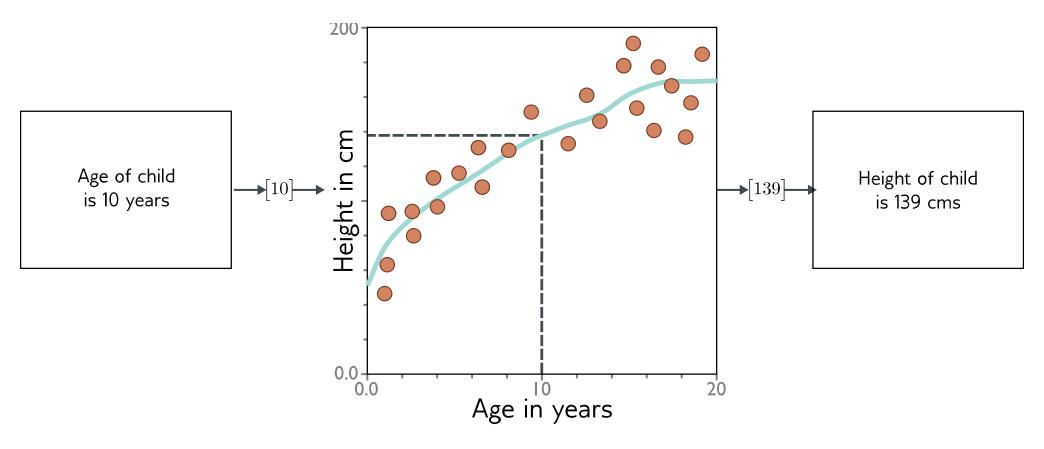

What is a supervised learning model?

- An equation relating input (age) to output (height)
- Search through family of possible equations to find one that fits training data well

What is a supervised learning model?

- Deep neural networks are just a very flexible family of equations
- Fitting deep neural networks = "Deep Learning"

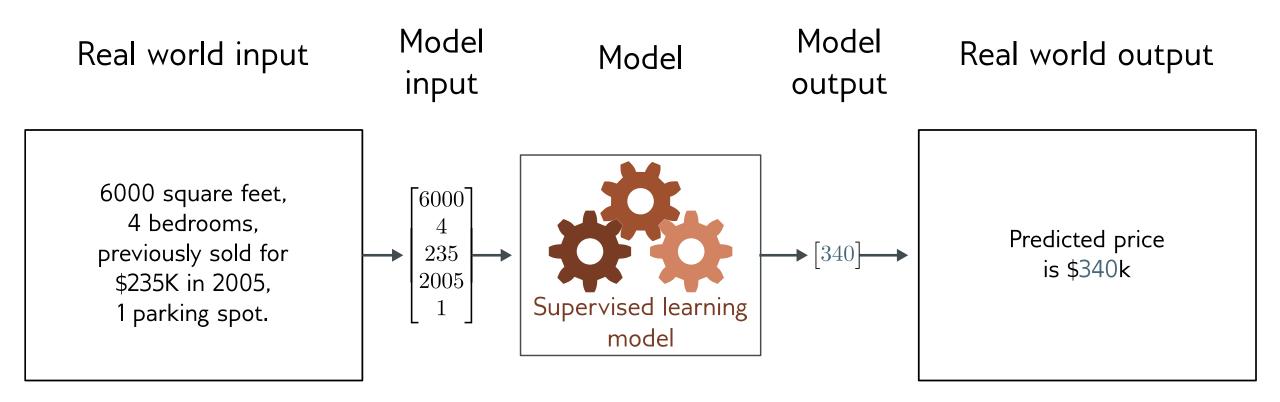

Prediction Types

- Regression
 - Prediction a continuous valued output

- Classification
 - Assigning input to one of a finite number of classes or categories
 - Two classes are a special case

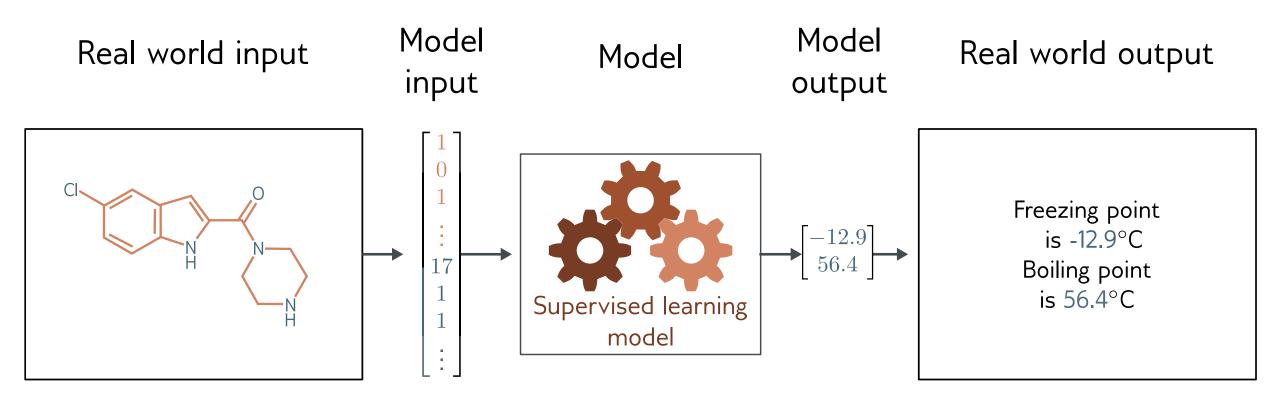

Can be univariate (one output) or multivariate (more than one output)

Regression

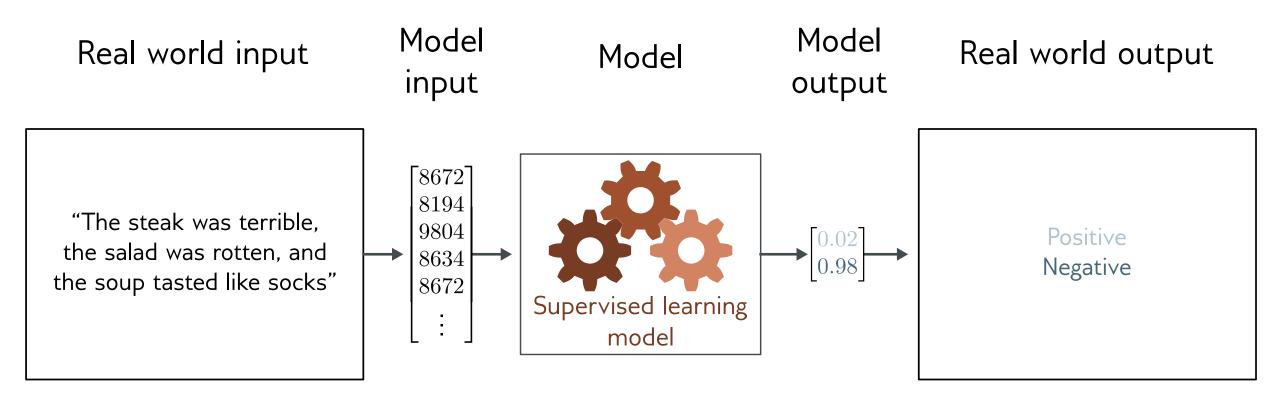

- Univariate regression problem (one output, real value)
- Fully connected network

Graph regression

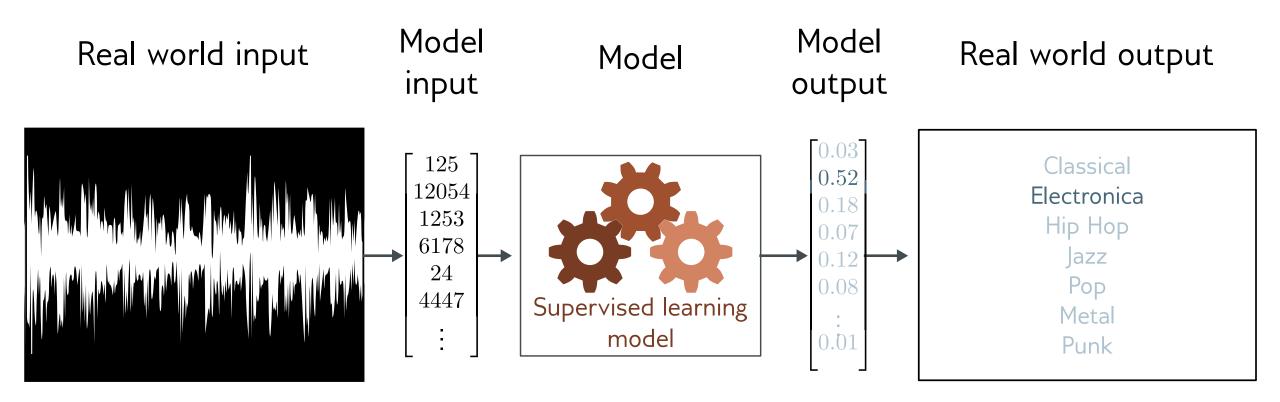

- Multivariate regression problem (>1 output, real value)
- Graph neural network

Text classification

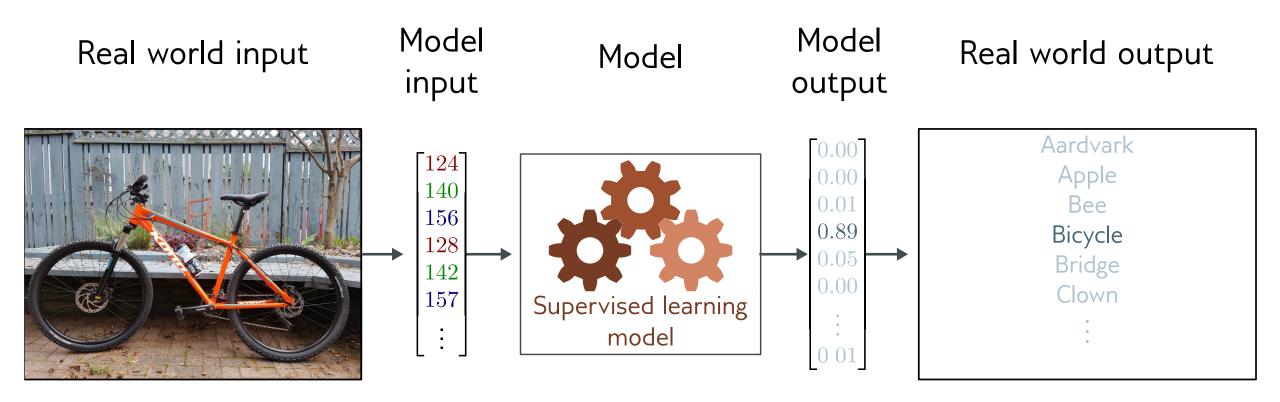

- Binary classification problem (two discrete classes)
- Transformer network

Music genre classification

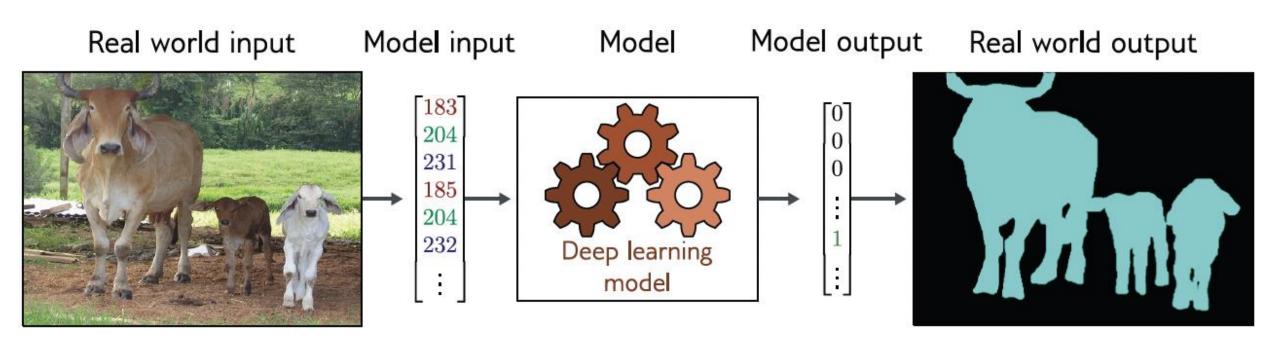

- Multiclass classification problem (discrete classes, >2 possible values)
- Recurrent neural network (RNN)

Image classification

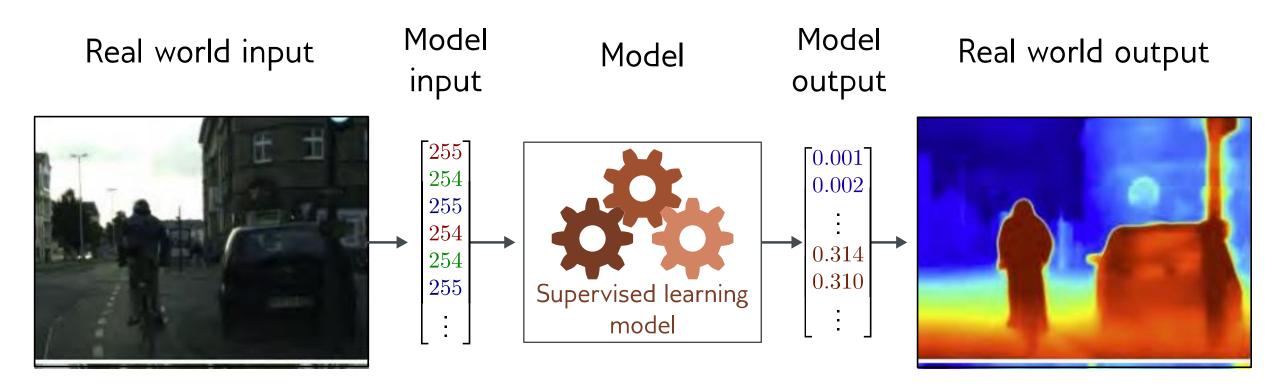

- Multiclass classification problem (discrete classes, >2 possible classes)
- Convolutional network

Image segmentation

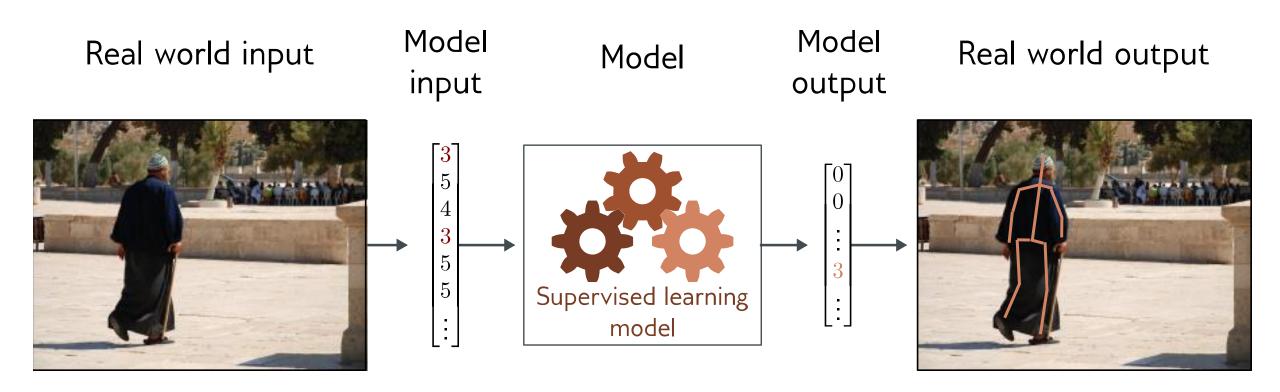

- Multivariate binary classification problem (many outputs, two discrete classes)
- Convolutional encoder-decoder network

Depth estimation

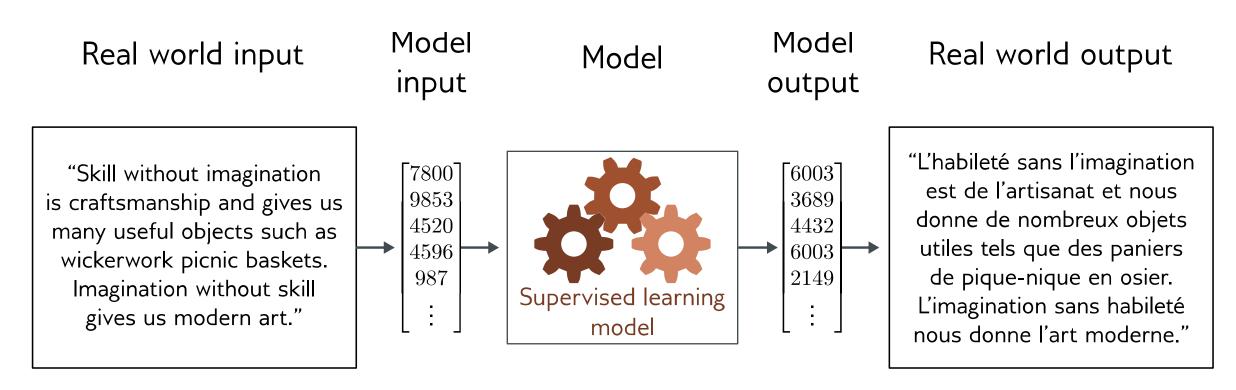

- Multivariate regression problem (many outputs, continuous)
- Convolutional encoder-decoder network

Pose estimation

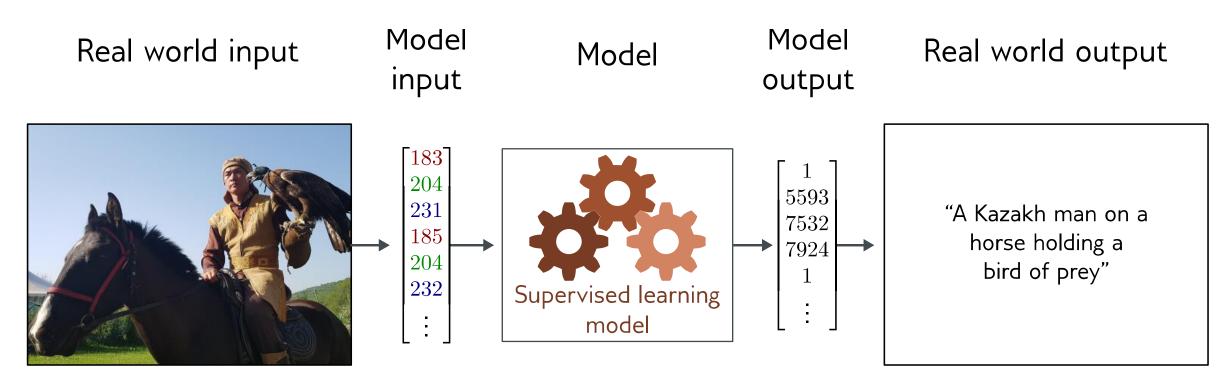

- Multivariate regression problem (many outputs, continuous)
- Convolutional encoder-decoder network

Translation

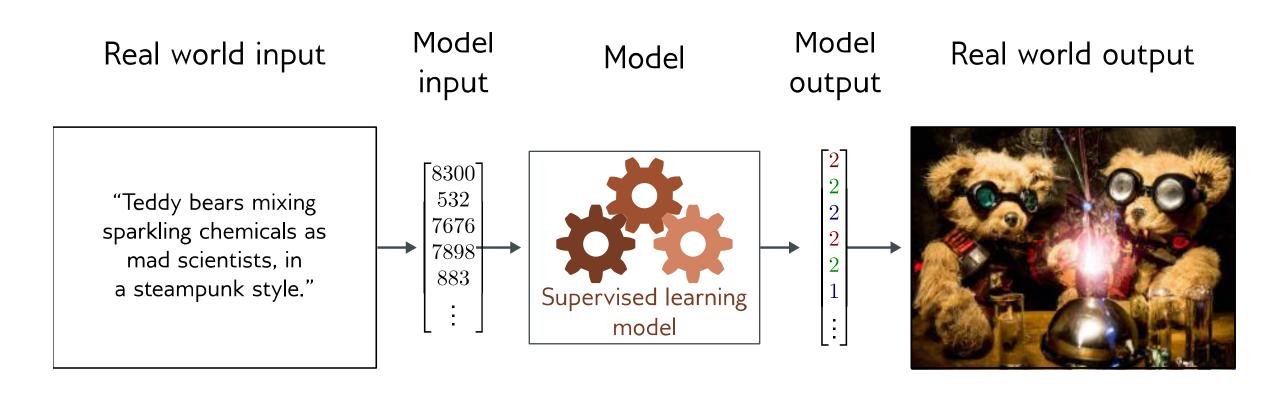

• Encoder-Decoder Transformer Networks

Image captioning

• E.g. CNN-RNN, LSTM, Transformers

Image generation from text

What do these examples have in common?

- Very complex relationship between input and output
- Sometimes may be many possible valid answers
- But outputs (and sometimes inputs) obey rules

"A Kazakh man on a horse holding a bird of prey"

Language obeys grammatical rules

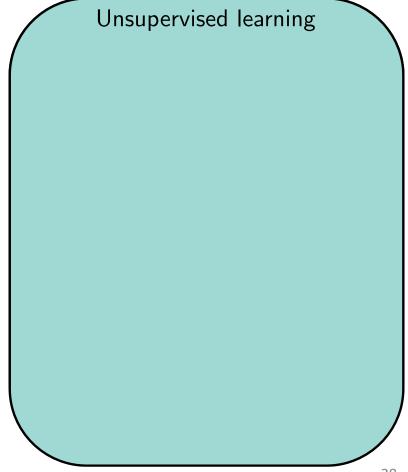

Natural images also have "rules"

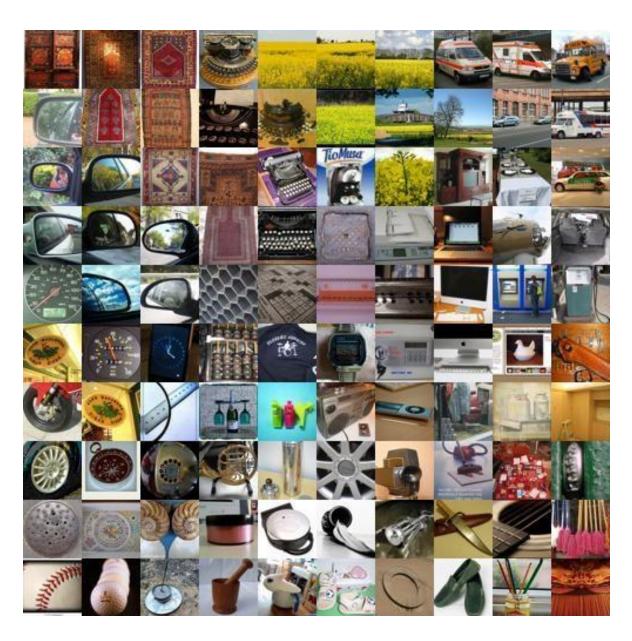

Idea

- Learn the "grammar" of the data from unlabeled examples
- Can use a gargantuan amount of data to do this (as unlabeled)
- Make the supervised learning task easier by having a lot of knowledge of possible outputs

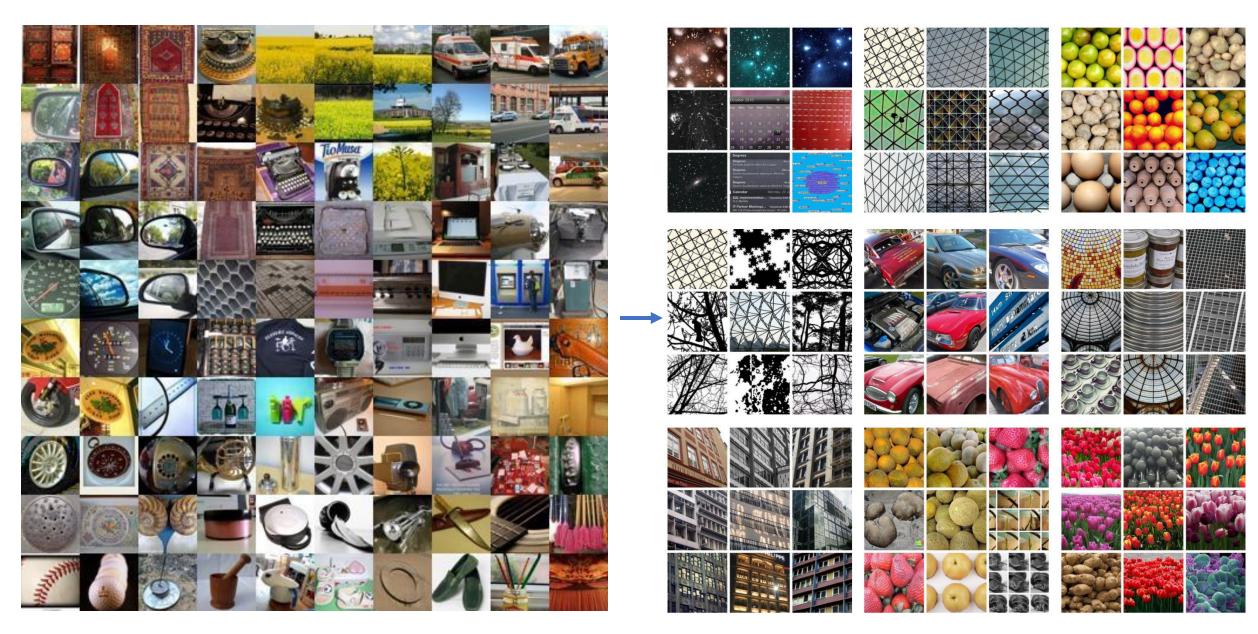

Unsupervised Learning

- Learning about a dataset without labels
 - Clustering
 - Finding outliers
 - Generating new examples
 - Filling in missing data

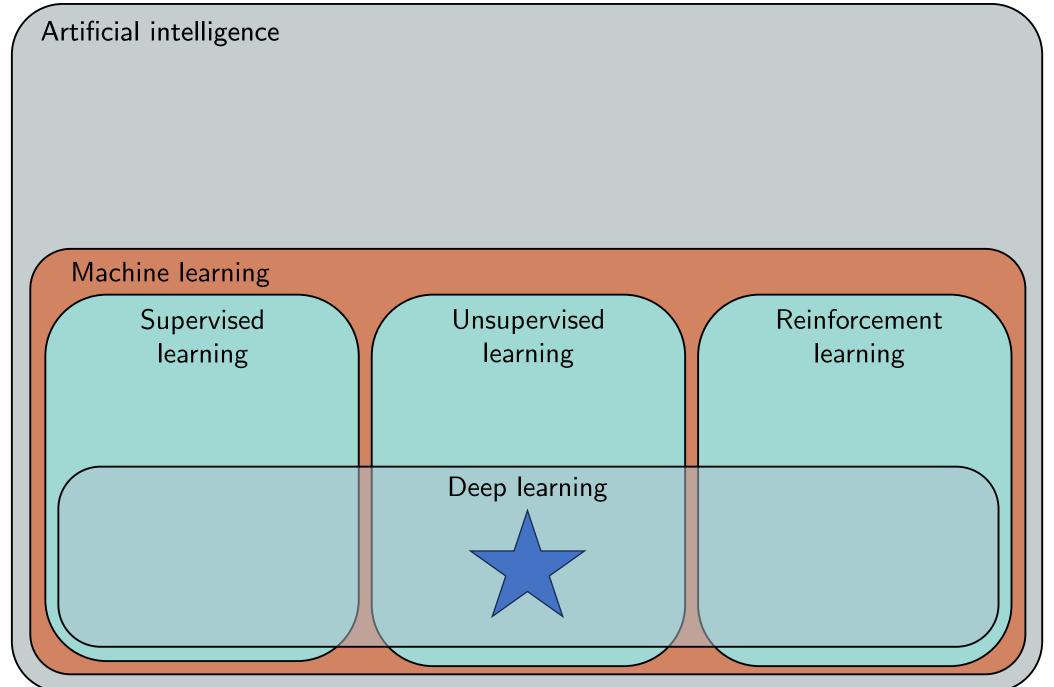

DeepCluster: Deep Clustering for Unsupervised Learning of Visual Features (Caron et al., 2018)

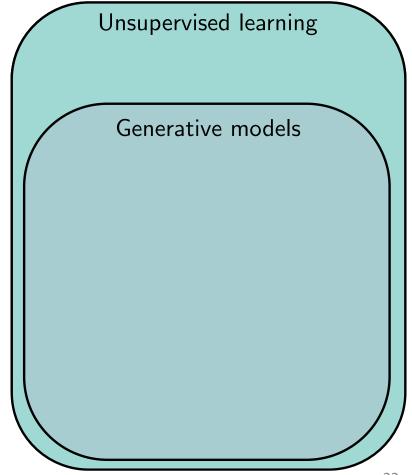

DeepCluster: Deep Clustering for Unsupervised Learning of Visual Features (Caron et al., 2018)

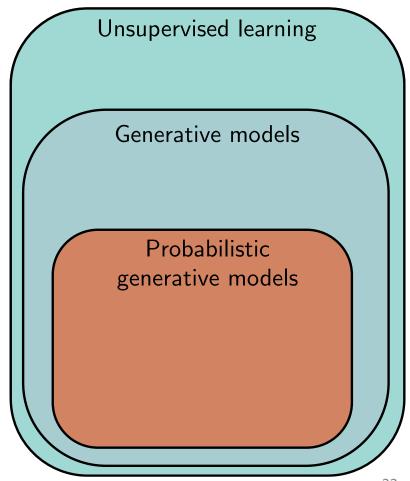

Unsupervised Learning

- Learning about a dataset without labels
 - e.g., clustering
- Generative models can create examples
 - e.g., generative adversarial networks

Unsupervised Learning

- Learning about a dataset without labels
 - e.g., clustering
- Generative models can create examples
 - e.g., generative adversarial networks
- Probabilistic Generative Models learn distribution over data
 - e.g., variational autoencoders,
 - e.g., normalizing flows,
 - e.g., diffusion models

Why should this work?

- 42 muscles control all possible expressions
- Restrictions on how faces and heads look subject to physics of illumination and reflectance, etc.
- The "manifold" of possible faces is much, much smaller than the combinatoric collection of pixel values

Interpolation

Axel Sauer, Katja Schwarz, and Andreas Geiger. 2022. StyleGAN-XL: Scaling StyleGAN to Large Diverse Datasets. In ACM SIGGRAPH 2022 Conference Proceedings (SIGGRAPH '22). Association for Computing Machinery, New York, NY, USA, Article 49, 1-10. https://doi.org/10.1145/3528233.3530738

Conditional synthesis

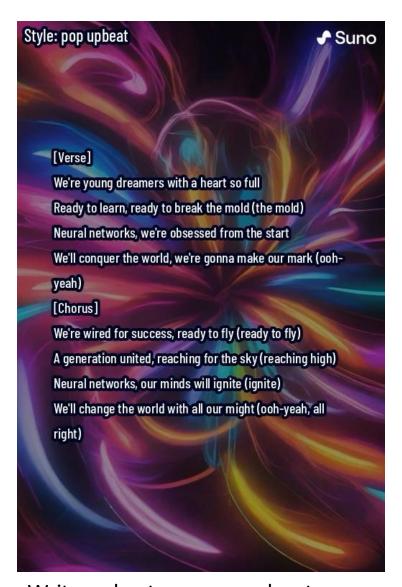

Saharia, C., Chan, W., Chang, H., Lee, C., Ho, J., Salimans, T., Fleet, D., & Norouzi, M. (2022a). Palette: Image-to-image diffusion models. ACM SIGGRAPH, (link)

Image/Video/Music Generation

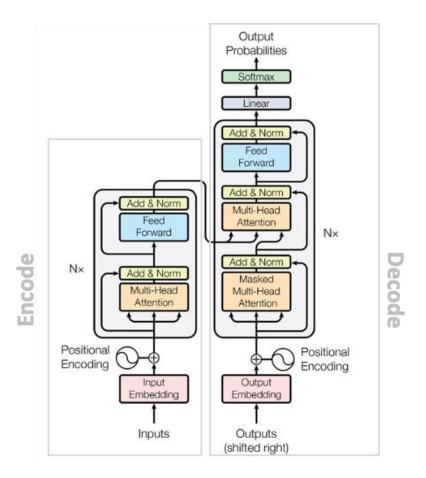

A teenage superhero fighting crime in an urban setting shown in the style of claymation.

Write a short pop song about students wanting to learn about neural networks and do great things with them.

Transformers, GPTs and Assistants

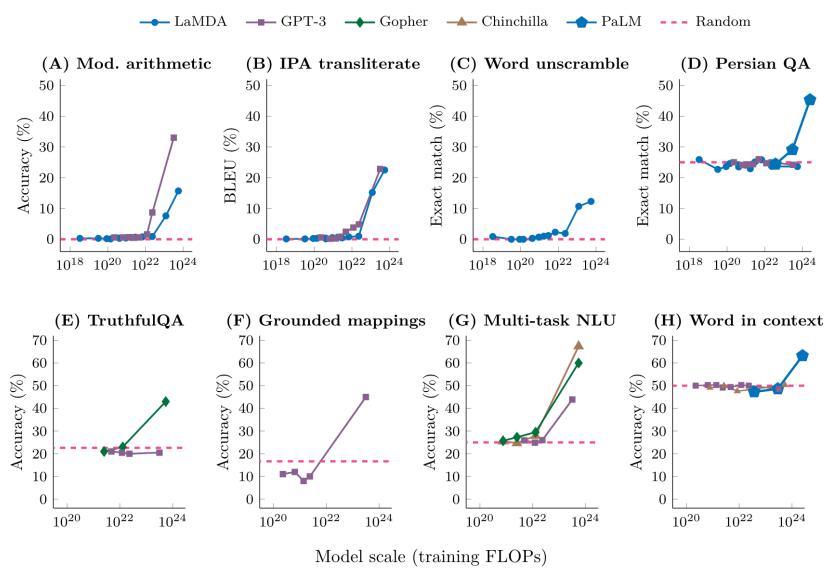

A. Vaswani *et al.*, "Attention is All you Need," presented at the 31st Conference on Neural Information Processing Systems (NIPS 2017), Long Beach, CA, USA, 2017, p. 11. [Online]. Available: https://arxiv.org/abs/1706.03762

Emergent Abilities of Large Language Models

History of Neural Networks

Abbreviated History of NNs

- 1943: McCulloch & Pitts Calculus of neurons
- 1947-49: Donald Hebb Plasticity of neurons
- 1956: Minsky, McCarthy, Shannon... Dartmouth Summer Research Project on Al
- 1957: Rosenblatt Perceptron, HW implementation of 20x20 CV
- 1959: Hubel & Weisel Visual cortex and receptive fields
- 1960: Widrow & Hoff Adaptive Linear Neuron (ADALINE)
- 1969: Minsky & Papert Perceptrons: computation limitations of neurons

Continued (abbreviated) History

- 1979 Fukushima: Neocognitron, cascade of neural structures that can classify shapes, invariant to shift, learned from data
- 1982 Hopfield Networks, recurrent artificial neural networks
- 1983 Hinton & Sejnowski: Boltzmann Machines
- 1985 Rumelhart, Hinton, Williams: Practical backpropagation
- 1989 LeCun Backprop on Convolutional Neural Networks
- 1991 Bottou & Galinari Automatic differentiation (autograd)
- 2012 AlexNet (CNN on GPU trained on ImageNet)
- 2016 Kaiming He: ResNet

Balancing Theory and Practice – Two Tracks

Course Outline -- Lectures

First Half

- 1. Intro, Project Ideas, Course Logistics
- 2. Supervised Learning
- Shallow Networks
- 4. Deep Networks
- 5. Loss Functions
- 6. Fitting Models
- 7. Gradients
- 8. Initialization
- 9. Measuring Performance
- 10. Regularization
- 11. Convolutional Neural Networks
- 12. Residual Networks
- 13. Recurrent Neural Networks
- 14. Transformers Part 1
- 15. Transformers Part 2

PyTorch

8

Second Half

- 16. Visual & Multimodal Transformers
- 17. Improving LLM Perf
- 18. Parameter Efficient Fine Tuning
- 19. Language Embeddings and Models
- 20. Unsupervised Learning and GANs
- 21. Variational Autoencoders
- 22. Diffusion Models
- 23. Graph Neural Networks
- 24. TBD
- 25. TBD
- **26.** Final Project Presentations
- **27.** Final Project Presentations

Discussion Outline*

Week	Discussion Content	Prev. Lectures
Week 1	SCC + Environment Setup	1.Intro to DL, Logistics 2.Supervised Learning
Week 2	Pytorch, Tensors, and Tensor Operations	Shallow Networks Loep networks
Week 3	How to read, load, and process data Intro to Model Building in Pytorch.	5.Loss Functions 6.Fitting Models
Week 4	Autograd, and Computational Graphs in Pytorch. +	7.Gradients and backprop 8.Initialization
Week 5	Intro to Model training, Internals of Model training (via code) •How models run on GPUs + How to construct Eval Metrics for Different Applications	9.Measuring Performance
Week 6	CNNs + Logging, Checkpointing, Tracking Experiments, Hyperparam tuning	10.Regularization 11.CNNs
Week 7	OH for setup of Midterm Competition	12.ResNets 13.RNNs
Week 8	Transformers + Code Examples	14.Transformers I 15.Transformers II
Week 9	VLMs + LLaVA	16. Vision and Multimodal Transformers 17. Improving LLM Perf
Week 10	LoRA, PEFT, ReFT - Latest Research on these	18.Parameter Efficient Fine-Tuning 19.Unsupervised Learning GANs
Week 11	VAE	20.VAE 21.Diffusion Models
Week 12	Diffusion Models	22.GNNs 23.RL
Week 13	Huggingface, diffusers library, langchain, etc	24.TBD 25.TBD

^{*}Subject to updates.

Grade Weighting – No "High Stakes" Exams

Item	Percentage
Final Project	45%
Mid-term Project/Competition	25%
Homeworks	25%
Attendance/Polls	5%

Course Project

- Work in teams of 2-3
- Can be application, algorithmic, theoretical or combination thereof
- Project proposal due ~Feb. 16
- Deliverables:
 - Code in GitHub repo
 - Report/paper
 - 3-4 minute video
- More info later, but feel free to brainstorm with me now

Spring 2024 Project Mini Conference

https://dl4ds.github.io/sp2024/miniconf.html

Look at Kaggle, Conferences, Workshops, Datasets....

- Application workshops at major conferences can be good sources of ideas. Often times they are associated with new and interesting datasets. Some potential conferences include:
 - Neurlps,
 - CVPR,
 - ICML,
 - ICMLA,
 - SPIE
- <u>Kaggle</u> and other competition websites can be a source of ideas.
- You might find some interesting datasets at <u>Papers</u> with <u>Code</u>
- Lot of applications are posted on X/Twitter, Reddit, LinkedIn, etc.

<u>Homework</u>

- Assignments approximately every week to help you check your understanding
- Jupyter notebooks and/or problem set
- Targeting release on Fridays and due a week later
- ~24 hour late due date with 10% penalty
- 7 days after grading to submit revision to recoup 75% or lost points
- The first assignment is your Statement of Purpose
 - What do you want to get out of the class?
 - What areas in particular interest you?
 - What's your learning style?
- See <u>course website</u> for late submission and revision policy

Jupyter Notebooks / Otter Grader

- Jupyter notebooks to help ground theory with python
- We'll be experimenting with using <u>Otter-Grader</u> for autograding and manually grading
 - Pay attention to instructions on how to collect and submit your notebooks
- You can do them on Google Colab or in your own environment, but Otter-Grader cells will not execute
- First notebook is out to get you started... reach out with questions

Attendance/Piazza Polls

There will be (at least one) in-class Piazza poll in each lecture to:

- help facilitate in-class discussion
- serve as quick knowledge check

It:

- will be opened in class for a few minutes and then closed immediately after,
- doubles as attendance proxy,
- will be graded pass/fail -- basically submit to pass

You must be in class to complete the poll.

You get four (4) absences with no excuse required as well as valid excused absences, e.g. illness. Please email instructor, preferably in advance of class.

Piazza Polls (wait for me to open)

- Supervised Learning: https://piazza.com/class/m5v834h9pcatx/post/6
- Key characteristics of neural nets: https://piazza.com/class/m5v834h9pcatx/post/7
- Unsupervised Learning: https://piazza.com/class/m5v834h9pcatx/post/8

Mid-term Kaggle Competition

- Work individually
- Details to be posted
- In-class presentations on your approach and results

Generative Al Assistance (GAIA) Policy

https://dl4ds.github.io/sp2024/index.html#gaia-policy

1. Give credit to AI tools whenever used, even if only to generate ideas rather than usable text, illustrations or code.

...

- 3. When using AI tools on _coding_ assignments, unless prohibited
 - Add the prompt text and tool used as comments before the generated code. Clarify whether the code was used as is, or modified somewhat, moderately or significantly.

...

5. Use AI tools wisely and intelligently, aiming to deepen understanding of subject matter and to support learning.

Focus on your learning objectives!

How to succeed in this class

- Do the readings before the lecture come with questions
- Stay on top of the Jupyter notebook and problem set knowledge checks
- Think about project ideas early. Talk about them with peers, advisors and instructor early and often.
- Put the time in on mid-term competition and final project... there's ramp up effort on both and the real returns come towards the end
- Be mindful of generative Al assistance. Your goal is proficiency and fluency. GAIA can rob you of that.

Most importantly!!

- Pursue your curiosity
- Challenge yourself intellectually in this exciting and fast-moving area
- Explore your interests

• ... and let's have fun!
